Preface

The OEM und Handel company of FAG Kugelfischer Georg Schäfer AG supplies rolling bearings, accessories and services to original equipment customers in the machine and plant construction sector as well as customers in the distribution and replacement sector. Broad rolling bearing know-how, competent advice for specific applications and extensive customer service for more operational reliability make FAG an indispensable partner to its customers. The development and progressive development of our products is based on the requirements of their future operation in the field. Ideally, the outline of requirements is drawn up jointly by our researchers and application engineers in cooperation with the machine manufacturers and operators. This forms the basis for convincing solutions both technically and economically speaking.

Our production sites are situated in Germany, Italy, Portugal, the USA and India. Marketing is effected through a network of subsidiaries and business partners spanning almost the whole world.

Time-saving bearing replacement at locations of restricted access

Split spherical roller bearings are mainly used for applications where the replacement of an unsplit spherical roller bearing would require intricate additional work, e.g. where gearwheels or couplings have to be withdrawn, drives dismounted, and shaftings disassembled. With split spherical roller bearings the downtimes of machines and plants is reduced and thus the production cost as well.

Cost reduction

Calculation examples on pages 26 and 27 show the extent of cost reduction which can be achieved by using split spherical roller bearings instead of unsplit ones. In one case the cost reduction amounts to about DM 80,000.00, in the other one even to about DM 430,000.00.

We have provided a form on page 28 which you may use to draw up a similar cost comparison for one of your applications. The filled-in form is a useful basis for talks with our service engineers.

With new constructions split spherical roller bearings help in many cases to save considerable cost since they simplify the assembly and facilitate mounting.

Ranges of application

Applications range from shafts supported by several bearings to bearing locations of restricted access, for example:

- belt drives
- ships
- conveyor plants
- rolling mills
- ventilation systems
- paper machines

Replacement bearings for spherical roller bearings with adapter sleeve

The dimensions of FAG split spherical roller bearings were adapted so that they can be used instead of unsplit spherical roller bearings and their adapter sleeves.

Outside diameter, outer ring width and shaft seat diameter are identical.

Fitting into split plummer block housings

FAG split spherical roller bearings can be mounted into FAG split plummer block housings without requiring any further machining of the housings. The same applies to housings from other manufacturers provided that the internal dimensions are identical.

Conveyor plant drive unit

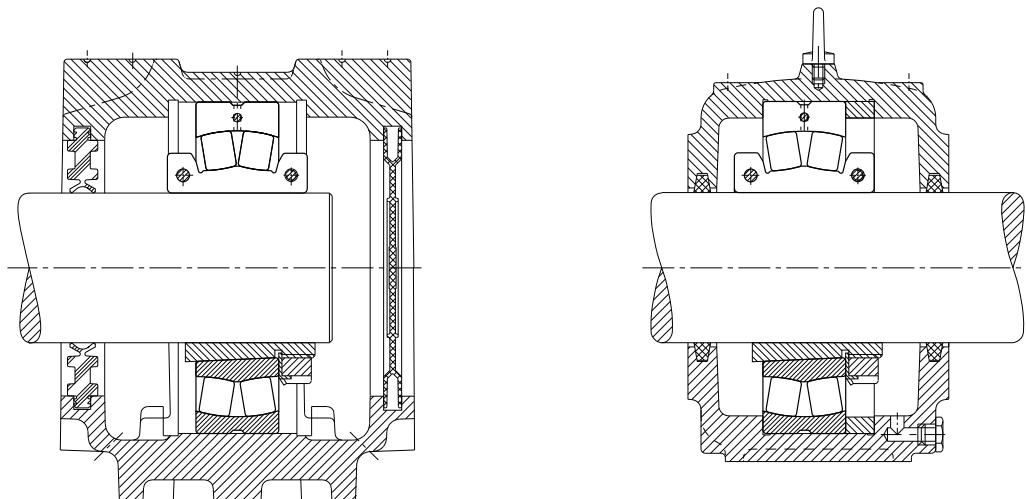

Ventilator drive unit

Time-saving bearing replacement · Fitting into split plummer block housings

1: Easy bearing replacement as split spherical roller bearings (top) require the same mounting space as unsplit bearings with adapter sleeves (bottom).

2: Easy to inspect, fast and easy mounting – the FAG split spherical roller bearing directly before mounting into an SNV housing.

Bearing design

FAG split spherical roller bearings have a cylindrical bore. Inner ring, outer ring and roller/cage assembly are split into halves. The split bearing rings are bolted together.

The internal design of the split spherical roller bearings was adapted from the well-proven spherical roller bearings of design E so that the bearings have maximum load carrying capacity.

The bearings are equipped either with a split moulded cage of glass-fibre rein-

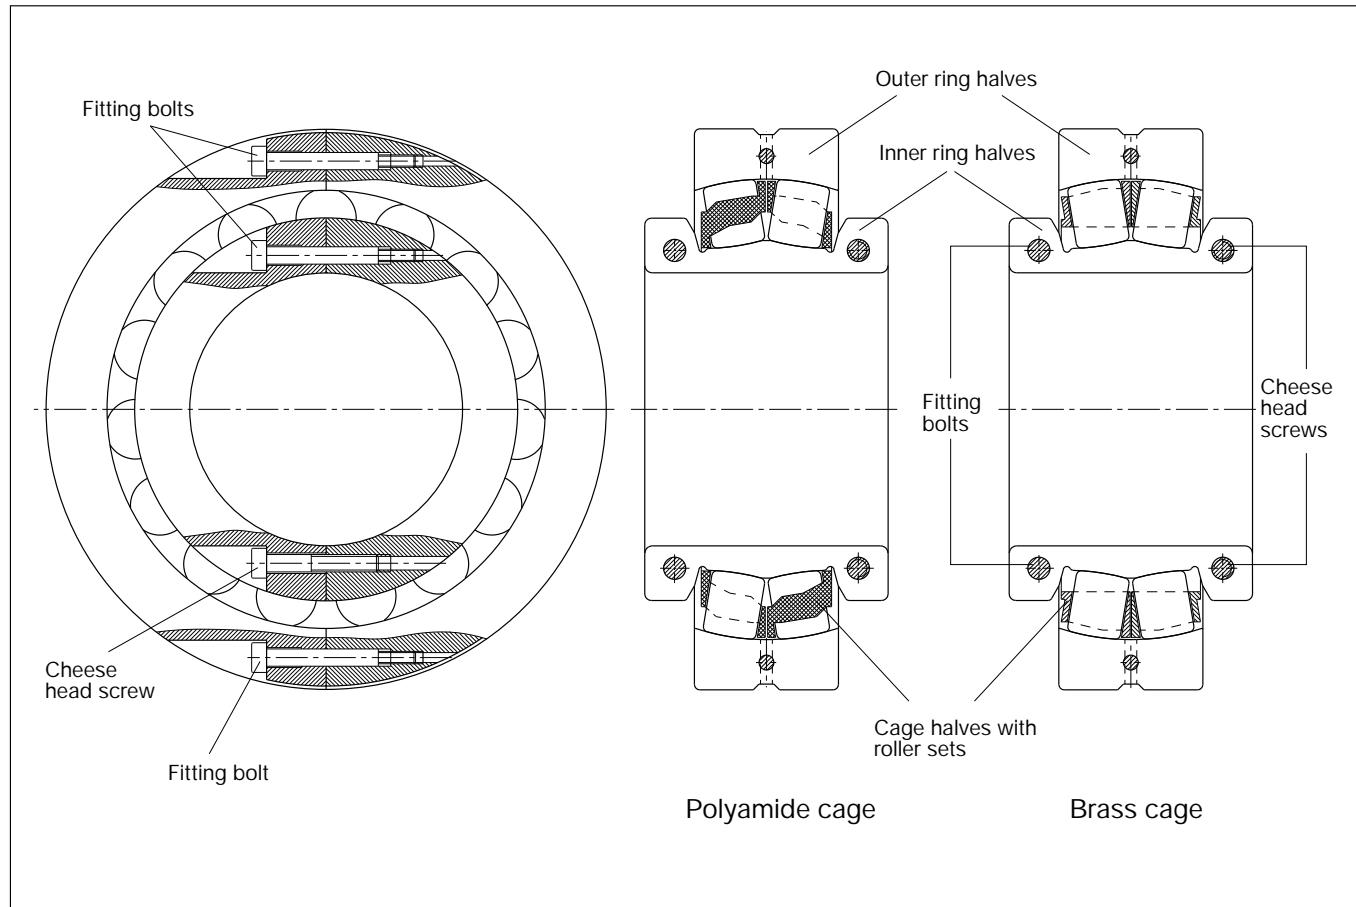

forced polyamide (suitability for high temperatures, see FAG catalogue WL 41 520) or with a split machined brass cage.

Split spherical roller bearings have the normal tolerances of unsplit radial bearings and the normal clearance of unsplit spherical roller bearings with a cylindrical bore (DIN 620).

In this publication the standard design of split spherical roller bearings is de-

scribed where the locking rings are integrated in the inner rings. FAG split spherical roller bearings with separate locking rings are recommended for applications where considerable temperature differences between shaft and inner ring halves may have to be accommodated, e.g. dryer rolls of paper machines. Information on this special design will be supplied by FAG on request (cp. FAG video "The Installation of Split Spherical Roller Bearings in the Dryer Section of a Paper Mill").

3: The internal design corresponds to the well-proven E design.

Load carrying capacity

The load carrying capacity of split spherical roller bearings is smaller than that of unsplit spherical roller bearings since the pitch circle for the roller/cage assembly is reduced due to the outer ring bolting. Nevertheless, a high load carrying capacity is achieved by providing the largest possible number of rollers with the largest possible diameter (E design).

Cycling of the separating joint is taken into consideration in calculating the equivalent dynamic load by the impact factor 1.1.

Bearing dimensioning is effected in accordance with the usual calculation procedure indicated in FAG catalogue WL 41 520.

High-speed suitability

The bearing tables indicate the kinematically permissible speeds. These values take into account the cage strength and the vibrations caused by cycling of the

separating joints. In cases where the kinematically permissible speeds are exceeded FAG Application Engineering must be consulted.

Fits

The shaft has to be machined to h6...h9 in order to attain the required tight inner ring fit after bolting. These shaft tolerances are also used for unsplit bearings mounted with adapter sleeves. Usually, the housing bore is machined to H7 or H8.

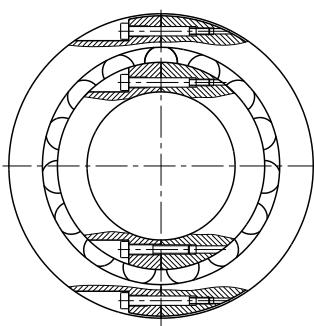

Lubrication

FAG split spherical roller bearings are usually lubricated with a lithium soap base grease of penetration class 2 with EP additives. The lubrication intervals are identical with those of unsplit bearings.

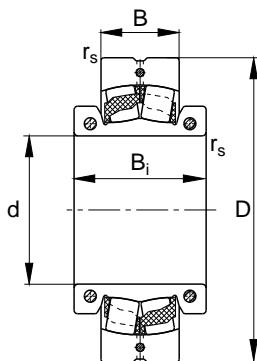

Split spherical roller bearings may be relubricated via a groove and holes in the outer ring.

The designs printed in **bold face** are produced in series.
Information on other designs will be supplied on request.

*) For inner rings which are not axially supported.

Equivalent dynamic load

$$P = 1.1 (F_r + Y \cdot F_a) \quad [\text{kN}]$$

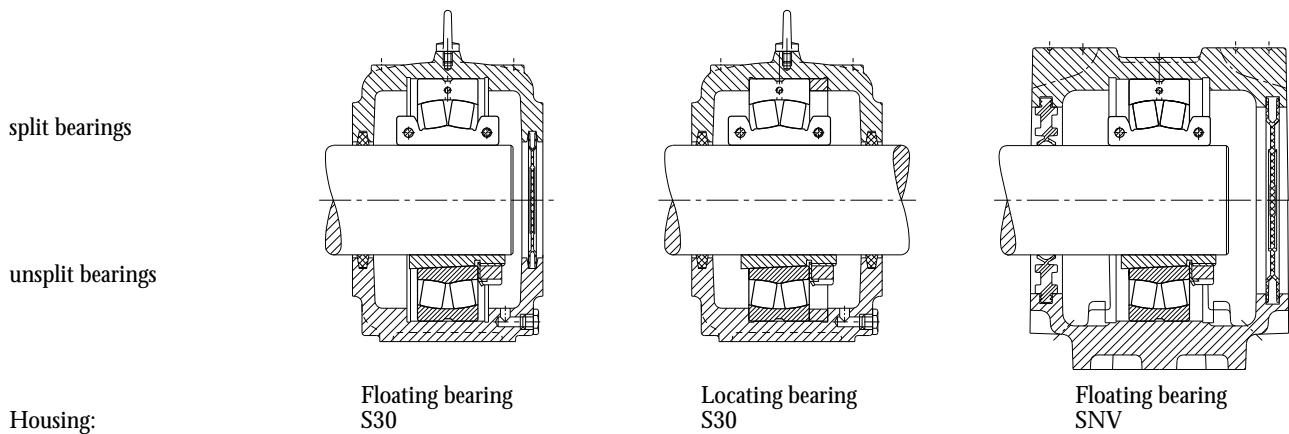

$$P = 1.1 (0.67 \cdot F_r + Y \cdot F_a) \quad [\text{kN}]$$

Equivalent static load

$$P_0 = F_r + Y_0 \cdot F_a \quad [\text{kN}]$$

P/C must be equal to or less than 0.2 to prevent the inner rings from creeping on the shaft in circumferential direction. Higher values are permissible if the speed is much lower than the kinematically permissible speed. Please consult our experts in such cases.

Cost reduction due to shorter downtimes

Example 1: Exhaust gas ventilator

Existing bearing with sleeve: 22226EK.C3+H3126 at drive end and opposite end
 FAG split bearing: 222SM115T

Required steps in bearing mounting and dismounting	
Unsplit bearing 22226EK.C3 + H3126	Split bearing 222SM115T
Disassemble couplings	not required
Loosen fastening bolts (housing bases)	not required
Remove coupling (mounted with feather key and shrink fit)	not required
Remove bearing at drive end (replaced as a precaution)	not required
Remove bearing at opposite end	yes
Install new bearing at opposite end	yes
Install new bearing at drive end	not required
Assembly in reverse order	-

Cost factors	Unsplit bearing 22226EK.C3 + H3126	Split bearing 222SM115T
Downtime	14 hours	3 hours
Downtime cost (disruption of production) (DM 39,000.00/h of ventilator downtime)	$14 \times \text{DM } 39,000.00 = \text{DM } 546,000.00$	$3 \times \text{DM } 39,000.00 = \text{DM } 117,000.00$
Man hours (2 men working 14 h each, 2 men working 3 h each) (hourly rate: DM 39.00)	$2 \times 14 = 28 \text{ h}$ $28 \times \text{DM } 39.00 = \text{DM } 1,090.00$	$2 \times 3 = 6 \text{ h}$ $6 \times \text{DM } 39.00 = \text{DM } 235.00$
Alignment (hourly rate: DM 65.00)	3 hours $3 \times \text{DM } 65.00 = \text{DM } 195.00$	not required
Crane rental	$4 \times \text{DM } 200.00 = \text{DM } 800.00$	not required
Replacement bearing (drive end) as a precaution	DM 650.00	not required
Replacement bearing (opposite end)	DM 650.00	DM 1,600.00
Total cost of bearing replacement	DM 549,385.00	DM 118,835.00

Cost saved by using
 FAG split spherical roller bearings DM 430,550.00

Cost reduction due to shorter downtimes

Example 2: Exhaust ventilator

Existing bearing with sleeve: 23152K.MB + H3152XHG at drive end and opposite end
 FAG split bearing: 231SM240MA

Required steps in bearing mounting and dismounting

Unsplit bearing 23152K.MB + H3152XHG	Split bearing 231SM240MA
Disassemble couplings at transmission input and output ends	not required
Loosen connection between foundation and electric motor	not required
Loosen fastening bolts (housing bases)	not required
Remove cover for easier lifting	not required
Use loops to suspend impeller	not required
Lift rotor using a crane	not required
Remove transmission using a crane (access to coupling)	not required
Remove coupling (mounted with feather key and shrink fit)	not required
Remove bearing at drive end (replaced as a precaution)	no
Remove bearing at opposite end	yes
Install new bearing at opposite end	yes
Install new bearing at drive end	not required
Assembly in reverse order	-
